
Recording: all streams stamped by one host clock
Human demonstrator
two hand-worn grippers
(HandUMI, third-party design)
flattens / folds a garment
wears
Wrist fisheye ×2
jaws, contact,
local cloth view
Wrist IMU ×2
gyro + accelerometer
Fixed RGB-D camera
4 fiducial markers per gripper
+ depth; global scene context
RGB + depth
rotation;
accel. in gaps
markers + depth
Jaw state
classifier + jaw-tip keypoints
on the wrist video
→ continuous aperture
Point tracking
CoTracker3 on the fixed camera,
lifted by depth, rigid fit
to the gripper; gated
tracks
Pose fusion
markers anchor the point tracks;
IMU acceleration only in gaps;
jaw tip in the robot-base frame
Calibration
camera ↔ robot base
(per camera move),
marker rig → jaw tip
Graded episodes
jaw-tip SE(3) + aperture;
still start / end trimmed;
GOLD / SILVER / REJECT
Training labels
Cartesian pose before IK,
stored absolute; relative
chunks built in the loader
train
Policy
pretrained on public
cloth data, fine-tuned
on GOLD demos
(training starts Oct 27)
relative motion
Bimanual robot → garment
receding horizon: FK → compose
→ limiter → IK → safety checks
→ a few steps, then re-plan
No longer used: wrist-camera SLAM gap filler (lost tracking at grasps) · IK → FK labels · whole-demo open-loop replay (finished, Oct 8–22)
